#### **Orange County Park User Z-Score Analyses**

This first table (below) shows the characteristics (i.e., responses to other questions) that are positively correlated with those who had visited Aliso Beach. For example, whites/Caucasians were much more likely to have visited Aliso Beach than were non-whites. Note, however, that this does not mean that all whites visited Aliso Beach; it simply means that whites visited Aliso Beach at a rate higher than that of non-whites. Likewise, those who indicated being dissatisfied with the restrooms were much more likely to have visited Aliso Beach than those who did not indicate dissatisfaction with the restrooms.

The stars (\*) in the column called "Z-SCORE" are a measure of the strength of the findings. For instance, three asterisks (\*\*\*) indicate that the finding is significant at the 0.001 level, or put another way, that the correlation would happen by chance only 1 in 1,000 times. Similarly, two asterisks (\*\*) denote a correlation that would happen by chance 1 in 100 times. A single asterisk (\*) indicates a correlation that would happen by chance only 5 times in 100 times.

All of the results shown in the tables below are statistically significant. That means that the relationships found in the analyses below are all highly unlikely to have happened by chance.
